First Nations Launch RECOVERY Webinar 2024

Presented by: Frank Nobile WSGC TECH TEAM – Tripoli Rocketry
February 6, 2024

The material contained in this document is based upon work supported by a National Aeronautics and Space Administration (NASA) grant or cooperative agreement. Any opinions, findings, conclusions or recommendations expressed in this material are those of the author and do not necessarily reflect the views of NASA.
Meet the FNL Team

Wisconsin Space Grant Foundation
• Kevin Crosby, Director
• Christine Bolz, Assistant Director
• Rob Cannon, FNL Project Manager
• Connie Engberg, Project Support Assistant
• Megan Goller, Accounts Assistant

First Nations Launch
• Frank Nobile, Technical Coordinator, Wisconsin Tripoli
• Mark Abotossaway, Project Assistant/Advisor Liaison, Blue Origin (Alumni)

Tripoli Rocket Association
• Bob Justus, Tripoli Assistant, Illinois Tripoli

ROCKET RECOVERY

SUMMARY

• RECOVERY PROFILE
• IT ALL STARTS IN THE AVIONICS BAY
• TYPES OF HARDWARE, ANCHOR POINTS AND CONNECTIONS
• DEPLOYMENT HARDWARE AND TECHNIQUES
• HOW TO ACHIEVE A SAFE RECOVERY
• LOCATING THE ROCKET
Recovery Flight Profile
Laws of Motion are Prevalent
Always mount altimeters, using non-metallic stand-offs to avoid damaging delicate components on the underside from being crushed. Assure wires are secured to the altimeter (Phoenix) terminals. (perform a gentle tug test). Understand the programed audible sequence of the altimeter.

The use of recommended fresh/charged batteries will optimize operating voltages, that is vital for altimeter performance. All redundant recovery systems must have a separate independent altimeter, power supply and energetics. Securing batteries to the deck of the avionic sled is essential. Primary battery connections should be doubled down securely.
TYPICAL MISSILE WORKS RRC3 ALTIMETER WIRED CORRECTLY FOR DUAL DEPLOYMENT RECOVERY

Review owners manual for proper function and wiring of all electronic devices in your rocket.
RESTRAINT HARDWARE

Restraint recovery hardware is available at most hardware stores, outdoor sporting shops and rocketry vendors.

Some quick links are stamped rated with a (WLL) Weight Limit Load or a (SWL) Strength Working Load. Stainless Steel restraint hardware are rated almost double the strength of the basic zinc coated steel quick links. Basic WLL/SWL of 400lbs for high-power rockets weighing below 25 lbs. is plenty sufficient for a fully loaded rocket. U-Bolts 7&8 have a SWL of 1500-2000 lbs. rating. #9 the forged galvanized eye bolt has a rating of 650 lbs. #10 - Stainless Steel Eye to Eye swivel should only be used for parachute attachments to recovery harness. Avoid attaching to bulk plates that bare the weight of the rocket. #6 – Avoid using open eye bolts. Their ratings are only 70-100 lbs.
Safety codes of both NAR and Tripoli (and the NFPA) require that a high-power rocket may be flown only if it contains a recovery system that will return all parts of the rocket safely to the ground so that it may be flown again.

For most high-power rockets, this goal is achieved using a parachute that is deployed when ejection charges in the rocket separate the rocket into multiple parts.
Parachute Descent Rate

A rocket at apogee under a small drogue parachute (using dual deployment) requires a descent rate of about 50-70 fps (34-47 mph). Deployment of the main parachute at any altitude should have a descent rate of 15-25 fps (10-17 mph). Observe the Velocity formulas below (left) to calculate the size chute to use or simply estimate your recovery descent rate using the RockSim program.

**Velocity During Recovery**

- **Drag Equation:**
  \[ D = \frac{C_d r V^2 A}{2} \]

- **During recovery, drag = weight.**
  \[ D = \frac{C_d r V^2 A}{2} = W \]

- **Solve for Velocity:**
  \[ V = \sqrt{\frac{2W}{C_d r A}} \]

---

RockSim Descent Calculation
Types of Rocket Recovery Harnesses

Tubular Nylon Facts
- 1 inch wide breaking strength is 4000 lbs
- Military grade
- Melting point 380 degrees Fahrenheit
- Easy to tie and untie

Kevlar Strap Facts
- Heat resistant strong synthetic fiber
- Related to other aramids such as Nomex
- .05” wide has a 1500 lb. breaking strength
- Created by Stephanie Kwolek, DuPont™ Kevlar® is a heat-resistant para-aramid synthetic fiber with a molecular structure of many inter-chain bonds that make Kevlar® incredibly strong. Best known for its use in ballistic body armor, Kevlar® also has many other applications because of its high tensile strength-to-weight ratio.

Nylon Flat Webbing
- .075” wide with a tensile strength of 3800 lbs
- Moderately heat resistant but should be inspected after each use
Length of the recovery harness, especially during the apogee deployment phase, should be 3 – 5 times the length of the rocket.

Providing this length, will ultimately cause drag as the harness unravels out of the airframe, reducing the velocity of the rocket during deployment.
Simple Avionic Bay
(Not to Scale)

Side View

1. Avionics Bay/Coupler
2. Forward coupler 7 ply 1/2" Birch bulk plate
3. Aft coupler 7 ply 1/2" Birch bulk plate
4. Payload mounting tube 1/2" Plumbing CPVC pipe (or equivalent)
5. Threaded rod stock 1/4" #20 or 5/16" dia #18
6. Avionic mounting board (PVC, Wood, G10 fiberglass)
7. Electronics, Altimeter, Recording devices
8. Bulkhead mounting nuts
9. Aluminum rivets (optional) or Epoxy board to tube
10. Electronics/Altimeter mounting bolts
11. 3/16" Hole for Apogee Ejection Wire
12. 3/16" Hole for Main Ejection Wire
13. Recovery U bolt
14. Removable Rivet

Note: Exploded view of Bulkheads for differences in design

Note: Aft bulkhead is beveled to fit inside coupler (3/16"

DEPLOYMENTS

Typical Dual Deployment Rocket
Using Satellite Deployment Canisters

Head-End Dual Deployment Explained | High Power Rocketry Basic HED Packing Tutorial (How I do it) - YouTube
RECOVERY IDEAS

Fig. 1 - The Y-harness design connected to the motor centering rings is very useful to avoid airframe damage such as zippering the airframe.

Fig. 2 - Harnesses epoxied to the booster motor tube with the Y – harness application.

Fig. 3 - Shows the Y – harness accompanied with a bowline or a figure eight loop knot to secure the remaining harness connection.

Fig. 4 - Standard use of a single harness connected to a U-bolt is sufficient for fiberglass airframes.

Fig. 5 - Recovery Y – harness comes through the notched-out centering ring. Both ends are epoxied to the motor tube.
Improvising a good connection with a polystyrene (plastic) molded nose cones may need extra attention. The recovery tabs can become brittle and subject to failure under moderate/high velocity deployments.
Securing the tail end of the knot is beneficial to keeping it connected.

**Figure eight knot**

**Single half hitch knot**
RECOVERY

1. Deployment canister(s) positioned directionally forward in booster section. (Forward motor centering ring).

2. E-Bay module with ejection well (canister) These canisters can be mounted on both aft and forward bulkheads.

3. Severe airframe zipper due to deployment/separation at high velocities during flight.

4a-b. Always mount recovery bulk plate above shoulder of a Polystyrene Nose cone.
ENERGETICS AND DEPLOYMENT STANDARDS

Fig. 1  FFFFFg black powder provides peak performance during deployment.
Fig. 2  Shows an E-match/w cardboard tube wired to a (European) terminal block that is inline connected to the altimeter inside the avionics bay.
Fig. 3-3a  Is an example of a simple deployment paper-pack that provides adequate ejection reliability for 4” or less diameter rockets.

Recovery testing  https://youtu.be/DagcRXK8bkM
Internal Deployment Devices

These devices are controlled by the altimeter in the avionics bay. Deployment activation occurs inside a designated airframe to deploy recovery hardware.

https://youtu.be/ibEwm-nd0UU
Some Operating Altimeters are attached externally tagged to the harness and parachutes after partial descent from apogee.

https://jollylogic.com/
PARACHUTE
PREPARATION

Straighten shroud lines. Spread and flatten parachute and fold in half twice. Position shroud lines in an “S” or hook shape atop of chute.

Fold in half, firmly roll parachute. Attach shroud lines to the recovery harness quick link.

Open chute protector cloth and connect protector to same quick link. Hold parachute above chute protector and lower the remaining shrouds and parachute in the center of chute protector.

Carefully fold and roll chute protector around parachute. Install the booster end harness into airframe followed with the packed parachute and remaining forward harness that’s connected to the sustainer (or nose cone).
Keep your rocket together

During the rocket's flight profile, inertia will greatly affect all friction coupled components after motor burn out, recovery deployment and descent.

2/56 shear Pins
2-56 Nylon Shear Pins (alwaysreadyrocketry.com)

Removable Rivets to secure avionic bay

Shear pin is fully inserted to secure nose cone to the airframe during flight.
Locating Your Rocket Without a Tracking System

You or a team member should watch the direction where the rocket lands. Mark a line in the gravel or lay a straight long object on the ground pointed in the general area the rocket landed. Pick a landmark where the rocket landed (i.e., tree, pole line) and pick a landmark inline directly behind you.

To enhance this manual technique, have person (a) who has the line on the rocket, stay at that location. Send another person (b) to retrieve the rocket, walking in line with directions from person (a). If the terrain is obstructed with brush or small ditch lines, have person (b) carry a small marker flag or a 6’ white PVC 1” pipe so person (a) can see person (b’s) location.

Taking a video or picture of the descending rocket before it lands will assist defining where the rocket lands. A small audible sonic beacon will aid the location of the rocket as you approach the landing area.

Using a smart phone with a compass app works great too. Open compass app before flight, following rocket as it lands, point phone toward the landing area and click on the compass heading. Walk in a straight line to the landing area keeping a look out for obstacles and maintain a straight heading with landmarks observed when rocket landed. Always assume the rocket may have landed farther than you perceived.

Sometimes locating or recovering your rocket can be a challenge. Be patient, take your time, stay focused where the rocket landed. Avoid hazardous obstacles. Taking a buddy with you on a rocket recovery adventure is encouraged. Wearing the proper attire, hiking shoes, leg coverings (pants), water, communication device, tools to turn off altimeter(s) or harness removal. Do not attempt to recover your rocket that will result you, being in an unsafe situation, by climbing a tree or water recovery. Call the head launch range coordinator for assistance. Write your contact information on rocket in case someone else locates it.
Any Questions?
